

toDoListApplication Test Case

Purpose: Create a web interface that allows a user to create a todo list.

Steps:

Action	Input	Expected Output
Launch application	Browse to http://localhost/toDoApp/	The login page appears with text boxes for username and password
Enter username and password	Enter either new or old username and password to use and click submit	The next page should display the current lists for the users and the number of tasks in each status
Add list	Click Add New List button	New page appears with textbox to enter new list name
Add list title	Enter title name and click submit	back to list display page but new list should be displayed
Add task to list	Click Add New Task link	New page appears with areas to enter fields for title, description, and due date
Complete add of task	Enter in information and click submit	Back to list display page again but the new task should be in the list
Start task	Click the start link for the task you want to start	Status should change from pending to started
Complete task	Click the complete link for the task you want to complete	Status should change from pending/started to complete
Filter List	Click the one of the status links at the top of the page	Will reload page with only the selected type of status for the tasks shown
Delete task	Click the delete link for the task you want to delete	The task should disappear from the list
Delete List	Click the delete list link for the list you wish to delete	The list should disappear from the page
